Cafe Latte

This challenge contains a game that I made for the Nintendo Wii U.

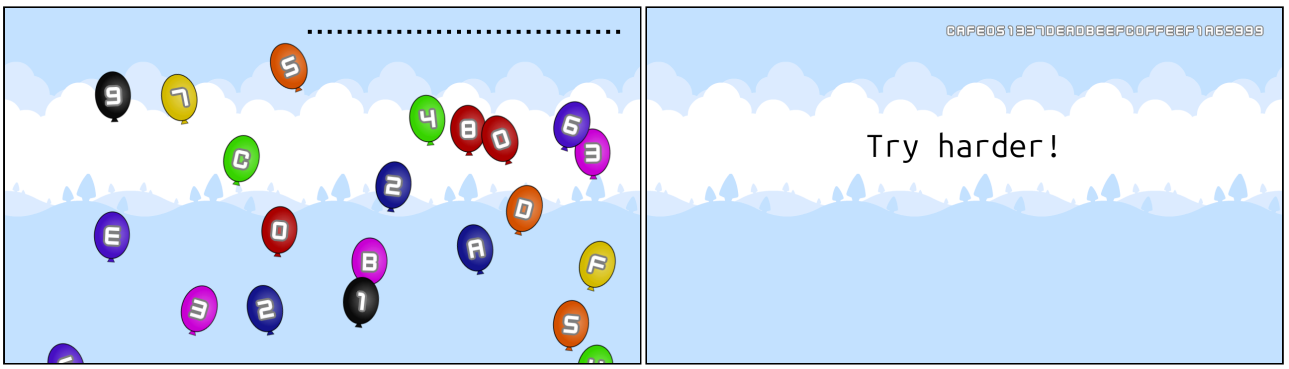
Challenge Name

The challenge name comes from the fact that various parts of the Wii U have coffee-related codenames, such as:

Name	Part
Cafe OS	The main operating system of the Wii U
Espresso	The main PowerPC CPU of the Wii U
Latte	The graphics processing unit of the Wii U
Starbuck	The ARM-based security processor of the Wii U
Barista	The Wii U menu software

Game Design

Pop balloons by tapping on them. If you pop the balloons in the correct order, the flag will appear. If not, try harder...



The assets for this game were taken from here and here.

Emulation

The game has been tested and was confirmed to work on a real Wii U with Aroma.

Because neither decaf-emu nor Cemu supports a particular feature that is used by the flag verification algorithm, you will not see the try harder message or flag if you run this game in an emulator. This means that you will likely need to resort to static analysis or implement the missing emulation part yourself.

Note: even on real hardware, no debugging tools are available for the component that executes the flag verification algorithm.
